## Transformer Protection Unit 2000R

The TPU-2000R is an advanced microprocessor-based Transformer Protection Unit designed for use on 3-phase power transformers. The TPU-2000R provides sensitive highspeed differential protection for internal phase and ground faults as well as time and instantaneous overcurrent protection for auto-, two winding and three winding transfomers. The user-selectable harmonic restraint setting prevents false tripping on magnetizing inrush and overexcitation.

The TPU-2000R can easily be set to operate based on the restraint curves of other electronic and electromechanical relays. This assures continuity with the user's past protective practices.

The phase compensation software setting eliminates the need for phase corrective wiring of the current transformer secondaries. The phase compensation setting is adjustable from 0 to 330 degrees, in 30 degree increments, allowing for most power transformer winding configurations.

The Harmonic Restraint record details the per-phase percent harmonic in each winding at the start and stop of a harmonic restraint condition so the restraint margin can be determined.

The 64 cycle per-phase event log and optional oscillographic record provide detailed system disturbance data.

Three groups of setting tables allow for on-line switching between groups for adaptive relaying techniques.

Separate pickup tap ranges and time-current curves are available for phase and ground overcurrent elements.

#### Features

- Four (4) selectable percentage restraint characteristics
- Three (3) selectable harmonic-restraint modes
- Ratio-matching taps with wide range and small step size decrease the percent mismatch to levels unobtainable by conventional relays
- Phase compensation for practically any main winding and current transformer secondary arrangement
- Six (6) overcurrent protective functions for each winding
- · Programmable logic inputs and outputs
- · Complete load current metering functions
- Menu-driven programming of settings
- Isolated communication ports provide superior remote communications
- Front and rear communications ports for simultaneous local and remote access
- Advanced 32 bit microprocessor technology
- The TPU-2000R is designed to permit complete electronic draw-out
- Models available for use with optical ct's.

#### **Protective Functions**

- Two or three winding, 3-phase differential current protection (87T & 87H)
- Three modes of harmonic restraint: 2nd, 2nd and 5th, all harmonics through the 11th
- Three-phase overcurrent protection (time and instantaneous) per winding (51P, 50P, 150P)
- Ground overcurrent protection (time and instantaneous) per winding (51N, 50N, 150N)
- Negative sequence overcurrent protection per winding (46)
- Three groups of setting tables: Primary, Alternate 1, and Alternate 2
- Eight programmable contact Inputs and six programmable output contacts with selectable delays of 0 to 60 seconds
- Nine user-selectable time-overcurrent characteristic curves
- Five instantaneous overcurrent characteristic curves
- · Three optional user-programmable overcurrent curves

#### Metering & Records

Oscillographic waveform capture and data storage capabilities

- Counters: differential trips, overcurrent trips, through-fault, through-fault kA summation for each phase, summation of through-fault duration in cycles
- Maximum and minimum demand amperes and demand power with time stamp for winding 1, winding 2 or winding 3 (if applicable)
- Per-phase current and voltage metering
- Differential fault records: last 16 trips
- Harmonic restraint records: last 32 events
- · Through-fault records: last 32 events
- Operations records: last 128 operations
- Accumulation of transformer through-fault kA and duration
- Optional load profile records: per-phase demand currents for up to 40 days at 15 minute intervals, 160 days at 60 minute intervals
- · Watt and VAR metering
- · Watt hour and VAR hour metering

Note: The screens, displays and records shown in this product bulletin represent the 2 Winding Unit. Refer to the instruction book for additional information on the 3 Winding Unit.

Descriptive Bulletin 41-372M

### Protective Functions

#### **Protective Functions Summary**

(per winding)

Differential Current Function: 87T

High Set Instantaneous Differential: **87H** (Unrestrained)

Time Overcurrent Functions: **51** (One function for phase and one function for ground)

Instantaneous Overcurrent Function: **50** (Two functions for phase and two functions for ground)

Negative Sequence: 46

#### **Differential Current Function: 87T**

The percentage differential restraint characteristic prevents operation until the differential current is greater than a certain percentage of the through current. This provides security against errors due to CT ratio mismatch, CT performance at high through-faults and operation of on-load tap changers.

| Four | Selectable Restraint Characteristics Curves  |
|------|--|
| Тар  | o ranges:  |
|      | 5-Amp CT: 2.0 to 9.0 A in 0.1 steps<br>1-Amp CT: 0.4 to 1.8 A in 0.02 steps  |
|      | 0.1-Amp CT: 0.04 to 0.18 in 0.02 steps<br>(For use with ABB Optical CT's)  |
|      | Adjustable percentage differential with a linear slope of <b>15%</b> to <b>60%</b> in 5% step increments with minimum sensitivity of 0.2 to 1.0 X per unit tap in 0.1 steps. |
|      | HU <b>30%</b> and HU <b>35%</b> characteristic curves with fixed minimum sensitivity of 0.3 and 0.35 per unit respectively   |
|      | Selectable percentage differential slope of <b>15%</b> , <b>25%</b> , or <b>40%</b> Tap with fixed minimum sensitivity of 0.3 per unit.                                      |
| Harı | monic Restraint  |
|      | Selection:   |
|      | 2nd, 2nd and 5th, or All Harmonics through the 11th  |
|      | Range:   |
|      | 2nd Harmonic: 7.5% to 25% in 2.5% steps  |
|      | 5th & All Harmonic: 15% to 40% in 2.5% steps   |
|      | Based on fundamental frequency   |
|      |  |

The fine adjustability of the tap settings allows you to minimize CT ratio mismatch. The adjustability of the percentage slope allows you to tailor the relay characteristic to your application.

The TPU-2000R allows for non-conventional Wye/Wye current transformer wiring for power transformers connected Delta/Wye. The Phase Angle Compensation setting is adjustable from 0° to 330° in 30° increments to allow the user to compensate through software for the phase shift through the power transformer windings. The relay also provides proper compensation for the chosen CT connections, which are entered in the configuration settings.

# High Set Instantaneous Differential 87H (Unrestrained)

• 6 to 20 times the 87T tap setting in increments of 0.1

### **Time Overcurrent Functions: 51**

One Phase setting and one Ground setting per winding

- Curve: Nine (9) ANSI time overcurrent curves and three (3) optional user-programmable characteristic curves (see Table 1).
- Pickup: 1 to 12 A in 0.1 increments or 0.2 to 2.4 A in 0.02 increments (based on catalog selection)
- Time dial selections: 1 to 10 in 0.1 steps
- Time delay selections: 0 to 10.0s in 0.1 steps (for Definite Time curve selection only)

#### Table 1. 2000R Time Overcurrent Curves

| Curve              | e Definition                    |
|--------------------|---------------------------------|
|                    | ANSI                            |
| Extremely Inverse  |                                 |
| Very Inverse       |                                 |
| Inverse            |                                 |
| Short Time Inverse | е                               |
| Definite Time      |                                 |
| Long Time Extrem   | nely Inverse                    |
| Long Time Very In  | iverse                          |
| Long Time Inverse  | 9                               |
| Recloser Curve     |                                 |
| User 1*            | * Only available with the       |
| User 2*            | user-programmable curve option. |
| User 3*            | -p                              |

#### Instantaneous Overcurrent Function: 50

(Two Phase settings and two Ground settings per winding)

#### 50P and 50N

- Curve: Five (5) overcurrent and three (3) user programmable characteristic curves (see Table 2).
- Pickup: 0.5 to 20 x (51P and 51N Pickup setting)
- Time dial selections: 1 to 10 in 0.1 steps
- Time delay: 0 to 9.99s in 0.01 steps (Definite Time Curve only)

#### Table 2. Instantaneous Overcurrent Curves

### **Curve Definition**

Standard Instantaneous Inverse Instantaneous Definite Time Short Time Inverse Short Time Ext. Inverse (3) User-Progr. Curves

#### 150P and 150N

- Pickup: 0.5 to 20 x (51P and 51N Pickup setting)
- Time delay: 0 to 9.99s in 0.01 steps (definite time)

#### Negative Sequence: 46 (per winding)

- Curve: Nine (9) time overcurrent and three (3) user programmable characteristic curves (see Table 1)
- Pickup: 1 to 12 A in 0.1 steps or 0.2 to 2.4 A in 0.02 steps (based on catalog selection)
- Time dial selections: 1 to 10 in 0.1 steps
- Time delay selections: 0 to 10.0s in 0.1 steps (for Definite Time curve selection only)

### Disturbance Settings

A disturbance setting can be configured as a percentage of the time overcurrent pickup setting to capture a through-fault record. A daisturbance record is captured when the pickup setting has been exceeded because of a through-fault condition through the transformer. The last 32 through-fault records are stored in the unit's nonvolatile memory.

### Alarm Settings

The fifteen alarm settings provide alarming functions to the counters shown on the right. Each alarm counter can be disabled or set to alarm at a user selectable threshold. Output contacts can be logically programmed "OR" or "AND" to any alarm counter.

## User Interface

You can change settings, monitor metering activities and view operations records through two interfaces: the Man-Machine Interface (MMI) and the External Communications Program (ECP) which is included with the TPU-2000R.

In addition, with the ECP you can logically map inputs and outputs to any associated logic function and you can download Oscillograaphic Data Storage files and Load Profile data (see "Optional Features").

|-----------|-----------|
| lb-1:3320 | lb-2:0    |
| lc-1: 100 | lc-2: 600 |
| In-1:100  | lg-2:0    |

#### Man Machine Interface (MMI)

The MMI consists of a four-row by twenty-character backlit LCD and a six-key access panel. During normal operation, the MMI continuously displays four currents for each winding. When a fault occurs, the MMI displays the eight current magnitudes at the time of the fault until the targets are reset. A "FAULTED CURRENTS" message also blinks in the first line of the display, indicating that a fault has occurred. Relay settings, metering, fault and operations records can be accessed directly from the MMI or via the ECP through the front or rear communications ports. For models with voltage inputs, the MMI continuously displays the selected winding currents and voltages. For models without the voltage inputs, the MMI continuously displays the currents of both windings.

#### **External Communications Program**

The External Communications Program (ECP) provides pointto-point communications with the TPU-2000R relay. You can easily program the TPU-2000R's various functions settings via the ECP. The ECP is a DOS<sup>®</sup>-based program and can be copied to your computer's hard drive. To invoke the program, type "tpuecp."

You also can use the software without the TPU-2000R relay to explore the capabilities and functionality of the relay. When the software is not connected to a TPU-2000R, the settings and configurations displayed are the factory default values. The relay settings can be saved to file and retrieved for downloading to a TPU-2000R later. When the software is connected to a TPU-2000R, the records can be viewed (Get Data From TPU-2000R), saved to a file (Save Data To Disk) and viewed later (Get Data From Disk).

The ECP contains terminal emulation commands to dial through a modem to access the relay or other devices connected to a remote modem.

## Metering

The Meter Menu of the ECP has the following selectable metered data:

- Load Values
- Demand Values
- Maximum and Minimum Demand Values
- Differential Values

#### Load Values

Page 4

Winding 1, Winding 2 & Winding 3 (if applicable)

Load metering is represented in per phase or three phase quantities depending on potential transformer configuration; WYE or DELTA. Units without the voltage option will only meter phase and neutral currents.

- Per phase currents la, lb and lc: amperes and degrees
- Neutral current In: amperes and degrees
- Positive and negative sequence currents I<sub>1</sub> and I<sub>2</sub>: amperes and degrees
- Per phase voltages kVan, kVbn, kVcn, kV1, kV2 and degrees

- Per phase kwatts kW-A, kW-B, kW-C, kW-3P
- Zero sequence currents In: amperes and degrees
- Per phase kilowatt hours kWHr-A, kWHr-B, kWHr-C, kWHr-3P
- Per phase KiloVARs kVAR-A, kVAR-B, kVAR-C, kVAR-3P
- Per phase KiloVAR hours kVARHr-A, kVARHr-B, kVARHr-C, kVARHr-3P

## **Optional Features**

#### Load Profile

This record stores per-phase currents for winding 1 or winding 2. Time intervals (demand constant) of 5, 15, 30 or 60 minutes can also be selected for which the load profile record will then contain 13.3, 40, 80 or 160 days of information, respectively. The recorded data is stored in a comma delimited ASCII format which allows for importing into most spreadsheet or text editor software for load and data analysis. The adjoining graph, created with a commercially available spreadsheet software, is a sample of the type of load profile data analysis that can be performed.

#### **Differential Values**

- Operate Currents—Phase A, B and C: magnitude in per unit [vectorial summation of winding 1, 2 and 3 (if applicable) restraint currents]
- Winding 1 Restraint Currents—A-1, B-1 and C-1: magnitude in per unit of 87T-1 tap setting and degrees
- Winding 2 Restraint Currents—A-2, B-2 and C-2; magnitude in per unit of 87T-2 tap setting and degrees
- Winding 3 Restraint Currents—A-3, B-3 and C-3. Magnitude in per unit of 87T-3 tap setting and degrees
- 2nd Harmonic Restraint Currents—A-1, B-1, C-1, A-2, B-2, C-2, A-3, B-3 and C-3 (if applicable) in percent of fundamental current
- 5th Harmonic Restraint Currents—A-1, B-1, C-1, A-2, B-2, C-2, A-3, B-3 and C-3 (if applicable) in percent of fundamental current
- All Harmonics Restraint Currents—A-1, B-1, C-1, A-2, B-2, C-2, A-3, B-3 and C-3 (if applicable) in percent of fundamental current

The differential metering screen allows easy confirmation of correct differential tap settings and relay connections during commissioning

#### **Oscillographic Display and Analysis Tool**

The TPU-2000R can be furnished with oscillographic data storage capability that captures and stores up to 64 cycles of waveform data for each of the eight input currents.

Eight time-stamped waveform records contain eight cycles of data. Thirty-two points per cycle for each of the eight analog input currents, Winding-1 and Winding-2 for both 2 Winding and 3 Winding units, and numerous protective and logic functions are stored in each waveform record. The capturing of waveform data can be triggered when the trip output is actuated or the waveform capture input (WCI) is initiated.

The TPU-2000R can also be programmed to trigger the capturing of waveform data on pickup of the following functions: 87T, 87H, 50N, 50P, 150N, 150P, 50G, 150G-2 and 46. Pre- and post-fault data can be captured by setting the trigger position in quarter-cycle increments within a range of 1 to 32 quarter cycles. Waveform capture can also be activated from an external contact, such as sudden pressure relay.

To the left is an example of a waveform capture displaying the inrush current on energization of the transfomer. These waveforms were displayed with the TPU-2000R's PC-based Oscillographic Analysis Tool.

The MATH button located on the Main Display window generates a Fast Fourier Transform of the user-selected phase current. A Spectral Analysis Tool window displays the percent harmonic content for the phase selected for Fourier Transform Analysis; a graphical representation of the Fourier Transform is also generated in the Spectral Analysis Display window.

## Automatic Tap Settings Calculation

The TPU-2000R has an automated differential tap setting calculation screen. You can automate your tap settings calculation by entering information at the Calculate Tap Settings screen.

The calculated values provided are as follows:

- Tap ratios
- 87T and 87H Tap settings
- Maximum transformer high and low side load currents (IH and IL)
- Maximum transformer high and low side through-fault currents (IHF and ILF)

- Maximum CT secondary currents on high and low side of the transformer (IHS and ILS) for transformer maximum load current
- Maximum CT secondary currents on high and low side of the transformer (IHFA and ILFS) for transformer maximum through-fault current.

## Records

#### **Differential Fault Records**

The last 16 differential fault records are stored. Each record includes the following information: record number; differential fault number; enabled settings table; tripping element; date and time of fault; fault clearing time in seconds; winding 1 and 2 tap settings; operate currents for all three phases; 2nd, 5th and total (2nd through 11th) harmonic current content in percent of fundamental for all three phase for both windings; three phase restraint current for both windings (magnitude and angle); and windings 1 and 2 phase and neutral currents (magnitude and angle), positive, negative and zero sequence currents (magnitude and angle).

#### **Through-fault Record**

A record is stored for the last 32 through-faults as a result of an Instantaneous (50) overcurrent, Time (51) overcurrent or Negative Sequence (46) trip condition. A through-fault record also is stored if the disturbance setting threshold has been exceeded. Each record contains the following information.

- Magnitudes and associated phase angles for winding 1 (WDG-1) and winding 2 (WDG-2)
  - la-1, lb-1, lc-1, ln-1; Zero (l<sub>0</sub>-1), Positive (l<sub>1</sub>-1) and Negative (I<sub>2</sub>-1) sequence currents (WDG-1)
  - la-2, lb-2, lc-2, lg-2; Zero (l<sub>0</sub>-2), Positive (l<sub>1</sub>-2) and Negative (I<sub>2</sub>-2) sequence currents (WDG-2)
- Through-fault record number
- · Fault clearing time
- · Fault number
- · Relay operate time
- Active setting table
- Date and time of fault

#### Harmonic Restraint Records

The last 32 harmonic restraint events are stored. An event starts when both the 87T is in pickup and the percent harmonic restraint setting is exceeded. An event ends when either the 87T drops out of pickup or the percent harmonic restraint drops below its setting.

Below is an example of a harmonic restraint event from the ECP. This data can also be accessed through the front panel MMI interface.

## **Operations Record**

This record stores the last 128 operations. The operations record includes the operation number, description of the operation and date and time of the operation. Operations include differeantial and overcurrent trips, activation of binary inputs and output contacts, loss of control power, editor access and all alarm conditions.

| Rec    | No | —— Operations Recom<br>Type | Date      | Time        | Value  |

#### **Operations Summary**

The Operations Summary record includes the following counters:

- Number of through-faults
- Through-fault kA summation phase A winding 2
- Number of overcurrent trips
- Through-fault kA summation phase B winding 2
- Number of differential trips
- Through-fault kA summation phase C winding 2
- Through-fault cycle (Duration) summation

## **Communications Ports**

The TPU-2000R is available with both front and rear communications ports. Both ports allow simultaneous local or remote data acquisition and verification and editing of relay settings. The TPU-2000R comes with a standard nine-pin RS-232C serial communications interface located on the front panel. This port is used to interrogate or program the unit via the PC-based External Communications Program (ECP). The ECP software is provided with the unit at no additional charge. ECP uses the 2000R series specific standard protocol, which is an ASCII byte-oriented protocol.

Optional communication port configurations are available on the rear of the TPU-2000R. These ports include:

- RS-232 (9-pin)
- RS-485 (3-wire)
- RS-485 Aux Comm Port
- IRIG-B (for precision time synchronization)
- INCOM<sup>™</sup> (2-wire) port
- Modbus Plus<sup>™</sup> port

The following optional protocols are available through the rear ports:

- STANDARD 2000R series specific byte-oriented protocol
- SPACOM—A byte-oriented communications protocol interfacing to SPA-bus
- Modbus<sup>®</sup> A byte-oriented communications protocol

#### **Unreported Records**

This record is used for SCADA system relay polling applications. Each new fault or operations record increases that record's counter. This counter flags SCADA during polling to initiate a download of the unreported records. When a record is polled (downloaded) by SCADA or viewed by the user through the Unreported Records menu in the ECP, the associated records counter decreases.

- INCOM<sup>™</sup>—A two-wire, RF carrier-based communications system and protocol
- DNP3.0 (IEC870)—An RS-485-based protocol through the Auxiliary Communications port

Contact your local ABB office for documentation for each of the protocols, or for information about the emulation of other SCADA protocols.

The baud rate for the front and rear ports is as follows:

- FRONT 300, 1200, 2400, 4800 or 9600

- REAR 300, 1200, 2400, 4800, 9600 or 19200

An ABB RS-232 to RS-485 converter (catalog no. 245X2000) can be used to connect a network of TPU-2000Rs to a modem or personal computer. For long runs and high electrical noise environments, fiber-optic communications links are recommended. An ABB RS-485 to fiber-optic converter (catalog no. 245X4000) can be used to network multiple TPU-2000Rs to a central communications center up to 1000 meters away.

See ordering information starting on page 24 for additional information on available port and protocol options.

## **User-Programmable Curves**

An external PC-based program, CurveGen, is used to create and program time-current curves for the TPU-2000R. This is the same program used on the ABB Distribution Protection Unit 2000 (DPU-2000). With CurveGen you can program time-overcurrent curves other than the factory pre-programmed curves in the TPU-2000R. You can manipulate the curves in the time and current domains just like any other curve currently programmed into the TPU-2000R. CurveGen generates all of the necessary variables for the user-defined curves to be stored in the TPU-2000R (i.e. the alpha's, beta's and pointers to the curve table). The method of accomplishing this task is curve definition.

There are multiple methods of generating user defined characteristic curves:

The standard curve entered into the TPU-2000R has the form of:

$$t = \frac{A}{M^{p} - C} + B$$

 $\boldsymbol{M}$  is the per-unit current above the pickup value

t is total trip time at M.

A, p, C and B are variables to be defined.

To define the curve, you must define the variables in this equation. There are two ways to do this:

- Manual entry of variables: This is designed for users who want to define curves through mathematical manipulation.
- Determine variables via curve fitting: Define a series of time versus current points and fit them to the standard equation listed above.

With the CurveGen program you can enter these series of time/current points from an already defined curve. CurveGen then fits the four variables to these points. There are two ways to enter these points into the CurveGen program:

- Enter all sampled points manually.
- File entry: CurveGen also can read files with points defined in them.

Once all the points are entered, the CurveGen program is cued to fit a standard curve. After A, p, C and B have been determined, you can plot the curve against the points given as well as determine the overall error of the curve versus the plotted points.

## **Operations Menu**

The Operationas Menu provides the operator the ability to control physical inputs and outputs, logical inputs or User Logical Outputs (ULO) without the need for a secondary test source injection. This allows the user to control specific physical connections and logical states to the relay through the Man-Machine Interface (MMI).

| Operations Menu   |
|---|
| Trip Breaker<br>Force Physical Input<br>Force Physical Output<br>Seal In/User Alarms<br>Force Logical Input<br>Return |
| Select Forcing State ———  |

#### **Physical Input / Output Status**

This contact input/output screen displays the present physical state of all permanently programmed and user-programmed digital input contacts and contact outputs. With this screen you can verify that the logic you programmed for input contacts is responding properly without physically measuring the input voltage status.

| IN 1<br>IN 23<br>IN 45<br>IN 66<br>IN 8 | ALT1<br>ALT2 | Open<br>Open<br>Open<br>Open<br>Open<br>Open<br>Open<br>Open | 0 Contacts<br>TRIP<br>OUT 1<br>OUT 2<br>OUT 3<br>OUT 3<br>OUT 4<br>OUT 5<br>OUT 6 | PRI Irip<br>SEC Irip<br>DIFF Irp<br>Hare Rut<br>IRP Fail<br>PICKUP | De-Energized<br>Energized<br>De-Energized<br>De-Energized<br>De-Energized<br>Energized |
|---|--------------|--|---|--|--|
|   |              |  | Hi  | t Any Key  | to Return  |

#### Test Menu

The Test Menu displays options for viewing the physical condition (Energized or De-Energized) and logic state (Open or Closed) of the programmable input and output contacts. This menu is useful in analyzing the programmed logic mapping of the output contacts and contact inputs.

#### **Logical Output Status**

Available only on the External Communications Program, the logical output screen shows the present status of the logical outputs, energized or de-energized. Use this screen to verify the proper operation of the relay functions' logic states.

#### **Output Contacts (Password Protected)**

The output contact test mode allows activation of all permanently programmed and user-programmed output contacts via the man-machine interface or the communications port.

#### **Logical Input Status**

Available only on the External Communications Program, the logical input screen shows the present status of the logical inputs.

## **Diagnostics**

The TPU-2000R provides continuous self-testing of its power supply voltages, memory elements, digital signal processor and program execution. In the event of a system failure, the protective functions are disabled and the self-check alarm contacts are actuated. Self-Test Failures are recorded in the Operations Record.

## **Programmable Output Contacts**

Six (6) user-programmable output contacts allow for logic OR or AND programming of any combination of functions to any user selectable output contact. Each contact may be assigned a time delay of 0 to 60 seconds in 10 millisecond increments.

#### The following list is a sample of some of the functions that the six user-programmable output contacts can be programmed to indicate:

| <ul> <li>Diff</li> </ul>  | 87T & 87H Differential Trip Alarm               | • PATA                        | Phase A Target LED Alarm                           |
|---------------------------|---|-------------------------------|--|
| <ul> <li>Alarm</li> </ul> | Self Check Alarm                                | • PBTA                        | Phase B Target LED Alarm                           |

## **Ratings And Tolerances**

#### **Current Input Circuits**

- 5-A input rating,16 A continuous and 450 A for 1 second
- 1-A input rating, 3 A continuous and 100 A for 1 second
- Input burden at 0.245 VA at 5 A (1-12A range)
- Input burden at 0.014 VA at 1 A (0.2-2.4A range)
- Frequency 50 or 60 Hz

#### **Voltage Input Circuit**

#### Voltage ratings based on the VT connection setting BURDEN

• 0.04 VA for V(A-N) at 120 Vac VOLTAGE

Wye Connection: 160 V continuous

Delta Connection: 260 V continuous

#### **Contact Input Circuits Voltage Range**

• 19 to 280 Vdc

#### **Contact Input Circuits (Input Burden)**

- 2.10 VA at 220 Vdc and 250 Vdc
- 0.52 VA at 125 Vdc and 110 Vdc
- 0.08 VA at 48 Vdc
- 0.02 VA at 24 Vdc

#### **Control Power Requirements**

- 48 Vdc model, range a 38 to 58 Vdc
- 110/125/220/250 Vdc models, range = 70 to 280 Vdc
- 24 Vdc model, range = 19 to 29 Vdc

#### Sampling Rate

• 32 Samples per cycle for all functions including protection, metering and oscillography

**Operating Temperature** 

Le-clos

— Ch ALT1 IN-1 NAME: LGC

c

- -40° to +70° C—Operating temperatures below -20° C may impede the LCD contrast.
- Per ANSI 37.90, up to 95% without condensation

#### **Output Contacts Ratings**

#### 125 Vdc

- 30 A tripping

#### Transient Immunity

- Surge withstand capability
  - SWC and fast transient tests per ANSI C37.90.1 and IEC 255-22-1 class III and 255-22-4 class IV for all connections except comm or AUX ports
  - Isolated comm ports and AUX ports per ANSI 37.90.1 using oscillatory SWC Test Wave only and per IEC 255-22-1 class III and 255-22-4 class III
  - Impulse voltage withstand test per IEC 255-5
  - EMI test per ANSI C37.90.2

#### Dielectric

- 3150 Vdc for 1 second, all circuits to ground except comm ports
- 2333 Vdc for 1 second, for isolated communication ports

#### Weight (Standard 2000R unit)

- Unboxed 5.4 kg (11.9 lbs)
- Boxed 5.7 kg (12.5 lbs)
- (weight may vary by approx, 1Kg (2lbs.) depending on unit configuration)

## **Ordering Instructions**

The 2000R series of relays have a structured catalog number ordering system. The unit's catalog number is built up from 13 customer-selectable characters. Each character identifies features or functions that can be incorporated into the relay.

#### How To Order

Using the Ordering Selection sheet, select those special features or options that are required to adapt the 2000R to your specific application. Create the catalog number, as shown above, by selecting the associated number or letter that refers to the desired feature or option from each category.

#### **Communication Port Configurations**

The 2000R platform provides several variations of communication ports, such as a 9-pin RS-232, RS-485, INCOM<sup>™</sup> and Modbus Plus<sup>™</sup>. Also available is a list of factory supported common communication protocols for networking the unit.

RS-232 ports are available in two different configurations, Isolated and Non-Isolated. Isolated ports provide isolation between the communication port and the rest of the relay.

COM 1 port is configured as a non-isolated port only. Units having an MMI display use the RS-232 port on the front panel as COM 1, thereby permanently disabling the RS-232 port marked COM 1 on the rear of the unit. Units not having an MMI Display permit the user to select, via jumper setting, either the front or rear (labeled COM 1) RS-232 connectors to act as COM 1.

COM 2 port is a non-isolated configuration and COM 3 port is an isolated configuration. Refer to the following list of options to select the most suitable configuration.

The 2000R series also features ABB's innovative RS-485 isolated communications capability available when the optional Auxiliary Communication board is installed. This isolated RS-485 configuration provides superior communication quality recommended for applications in areas of high electrical noise or that require connecting cables longer than 10 feet (3m).

# NOTE: Non-isolated RS-232 ports are suscepatible to electrical noise. For that reason it is recommended that connecting cables be no longer than 10 feet (3m) when connecting to a non-isolated port. Devices connected to non-isolated ports must have the same ground return as the 2000R unit.

Refer to the Select Communication Options Table when making option selections.

In addition to the standard front or rear non-isolated RS-232 port (COM 1), the following rear communication port options are available:

#### Option 0

This option provides RS-232 communication via the non-isolated COM 2 port and is suitable only in applications where communication to the unit is local through a direct connection to a PC or remote through an external isolating communication device , such as an RS-232 to fiber optic converter, which is connected to the relay using a short cable.

Options 1 through 8 are provided on an independent communication card installed in the unit.

#### **Option 1**

This option provides RS-232 communication via the isolated COM 3 port for transient immunity and isolation and must be used where communication cable lengths are greater than 10 feet (3m) or a common ground is not guaranteed. In general, RS-232 communication is limited to a maximum distance of 50 feet (15m). Aux Com and COM 2 ports are disabled in this configuration.

#### **Option 2**

This option provides RS-232 communication via isolated COM 3 port and RS-485 communication via the isolated Aux Com ports. The auxiliary port is an isolated RS-485 configuration that supports several communication protocols (*See Communication Protocol Category On Ordering Sheet*).

#### **Option 3**

This option provides INCOM<sup>™</sup> availability, via the Aux Com port, in applications where either the Westinghouse INCOM<sup>™</sup>, or ABB WRELCOM<sup>™</sup>, network is used.

#### **Option 4**

This option provides RS-485 communication and INCOM<sup>™</sup> availability, via the isolated Aux Com port. In this configuration, the INCOM<sup>™</sup> port provides the same functionality as option 3.

#### **Option 5**

This option provides RS-485 communication via the isolated Aux Com port and is highly recommended for applications requiring communication over distances of up to 300 feet (100m). This option has an advantage over RS-232 by allowing networking of multiple relays via a simple 3 wire connection.

An RS-485 to RS-232 converter (Catalog Number 245X2000) is available to connect the network to an external device such as a modem or a personal computer.

#### Option 6

This option provides a Modbus Plus<sup>™</sup> interface, via the COM 3 port, and RS-232 communication via the non-isolated COM port.

#### **Option 7**

This option provides a Modbus Plus™ interface via the COM 3 and RS-485 communication via the isolated Aux Com port.

#### **Option 8**

This option provides RS-485 communication via the isolated COM 3 and Aux Com ports.

#### **Communication Protocols**

The Select Options Table shows the communication protocols and the respective hardware port assignments that are currently available.

#### The "Standard" Protocol

The "Standard" protocol referenced throughout this publication refers to an ABB 2000 series-specific 10 byte ASCII oriented communication protocol. This protocol is standard for COM 1 and is selectable for other rear ports as per the Select Options Table. The 2000 series External Communication Program (ECP) provided, at no charge, with the relay uses the standard protocol.

Product specific protocol documents are available from the factory upon request.

#### **Software Options**

The software options available on the 2000R series include Load Profile, User Programmable Curves, and Oscillograhic Data. Any combination of these options may be selected.

3 character locations in the catalog number define your selection of software options.

- Oscillographics
- User Programmable Curves
- Load Profile

Modbus Plus<sup>™</sup> is a trademark of Modicon, Inc. Modbus<sup>®</sup> is a registered trademark of Modicon, Inc. INCOM<sup>™</sup> is a registered trademark of Cutler Hammer Corporation.

The table below illustrates all possible hardware configurations for the communication ports and the supported protocols. The Catalog Number Select Option columns list every communication option for which the relays can be configured.

The different protocol variations are outlined under the corresponding communication ports that support them. Select the row containing the protocol combination that best suits your communications requirements and use the corresponding catalog number options to fill in the brackets [] of the catalog number.

The auxiliary port labelled IRIG-B receives a demodulated IRIG-B signal for 2000R clock synchronization purposes.

For example, if your system requires DNP 3.0 (IEC870-5) protocol, the ordering catalog number would be 588R041[2]-6101[1] (4th row), 588R041[4]-6101[1](10th row) or 588R041[8]-6101[1](18th row) based on your choice for the second port provided.

Select other characteristics of the relay from the chart on page 28.

|  |           |         |   |                                | REAR PORT ASSIGN                                       | MENTS  |                |                    |

## **Panel Mounting Kit:**

The complete kit will include a bezel, its associated hardware and gasket, as well as a lens cover with its associated hardware. This kit will provide a means for panel mounting and dustproofing.
